04 **FUTURE WORK**
Conclusion

BACKGROUND & MOTIVATION

INTERNSHIP

Startet in May in Marketing & Communications

WEB TEAM

worked on large-scale projects

MAJOR TASK

Full website migration (~1,600 pages)

ISSUES

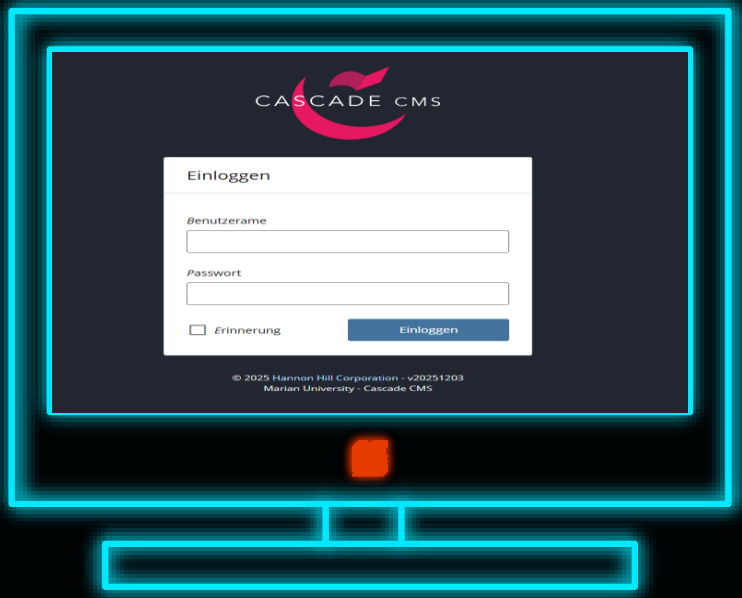
broken links, missing redirects, outdated content

IDEA

tool to automate link checking

WHY THIS PROJECT MATTERS

- Website migration revealed broken links & Cascade login links
- ~1,600 pages → impossible to check manually
- Issues often found by accident
- Departments frequently request help fixing links
- Time-consuming and inefficient process
- My crawler:
  - Automatically scans all pages
  - Detects broken + Cascade login links
  - Shows exactly where problems appear
  - Provides clear reports for fast fixes



CASCADE LOGIN LINK

- Some public pages accidentally link to internal admin login pages
- These pages should only be visible to the Web Team
- For users, seeing this link = broken / incorrect link
- My crawler detects these links the same way as broken links

LINK SUMMARY

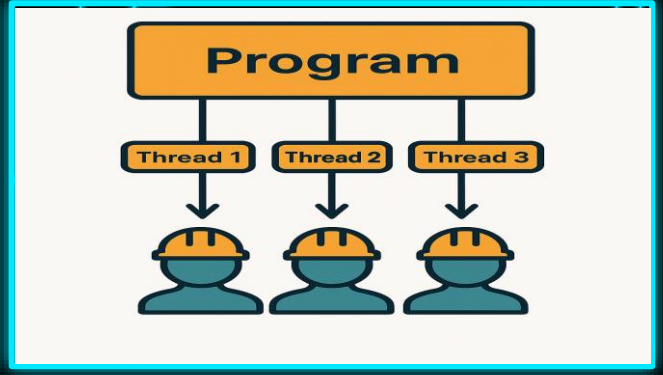
SYSTEM OVERVIEW

3 main components

- Scheduler: loads sitemap & queues URLs
- Worker Threads: process pages in parallel
- Cache Layer: avoids repeated HTTP requests

Config via YAML

- Choose FIFO or Priority mode
- Enable/disable cache
- Easy for the web team to adjust



WHY THREADS?

- Threads = multiple workers running in parallel
- Great for I/O-bound tasks like HTTP requests
- Allows:
  - Multiple pages checked at once
  - Network delay hidden
  - Faster overall crawl
- Performance:
  - 1 thread → ~40 min
  - 12 threads → 3–5 min

LRU CACHE (LEAST RECENTLY USED)

- Stores results of previously checked URLs
- Avoids re-downloading the same page
- Benefits:
  - Saves network traffic
  - Speeds up the crawl
  - Prevents redundant checks
- Removes the least recently used item when full

```python
while True:
    try:
        url = frontier.get_nowait()
    except queue.Empty:
        break

    # Duplicate-Schutz
    with vlock:
        if url in visited:
            frontier.task_done()
            continue
        visited.add(url)

    _rate_limit(delay)

    t_name = threading.current_thread().name
    ts_start = datetime.utcnow().isoformat(timespec="seconds") + "Z"
    t0 = perf_counter()
```

```python
resp = session.get(url, headers=headers, timeout=timeout, allow_redirects=True)

if extract and resp.ok and "text/html" in ctype.lower():
    link_info = _extract_internal_links(...)
    links_for_page = link_info["links"]
```

WORKER LOGIC

- Takes URL from shared queue
- Checks if page was already visited
- Sends rate-limited HTTP request
- Extracts internal links from HTML
- Checks each link (Cascade login / broken link)
- Records violations + page summary
- Thread-safe writing using locks

FUTURE WORK

PDF SCANNING

- Detect outdated content
- Identify PDFs

WEB APPLICATION

- Run crawler without my device

CSV REPORTS

- Automatic CSV reports for the whole web team

MONITORING

- Potential for full website quality monitoring tool

CONCLUSION

- Combined Operating Systems concepts with real web team needs
- Built a fast, safe, flexible crawler
- Scans entire website in minutes instead of hours
- Helps Marian fix broken links & Cascade login links across 1,600+ pages
- Saves time & improves overall website quality
- Strong potential for future extensions (PDF scanning, dashboard, web app)

THANKS!
